1 Experiments on hyperparameter α

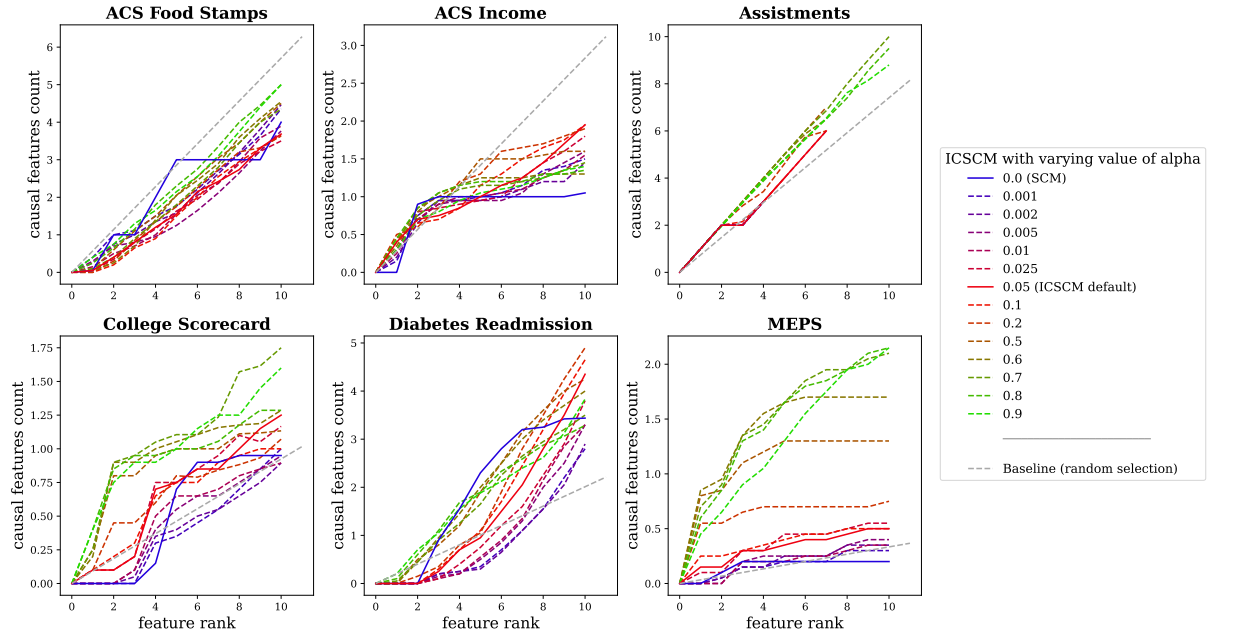

Figure 1: Causal scores of ICSCM models for varying value of α . Number of causal features discovered as a function of the model size (feature rank) for real-world datasets. The colored lines give the average causal feature count over 20 repetitions. The gray dashed line indicates the expected number of causal variables selected by a random pick.

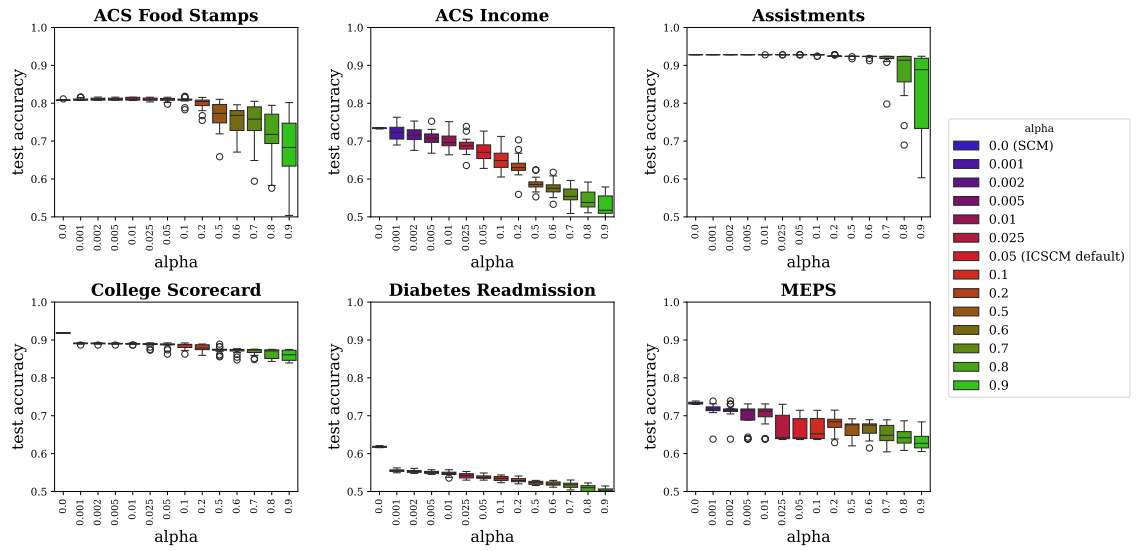

Figure 2: Accuracy scores of ICSCM models for varying value of α . Number of causal features discovered as a function of the model size (feature rank) for real-world datasets. The colored lines give the average causal feature count over 20 repetitions. The gray dashed line indicates the expected number of causal variables selected by a random pick.

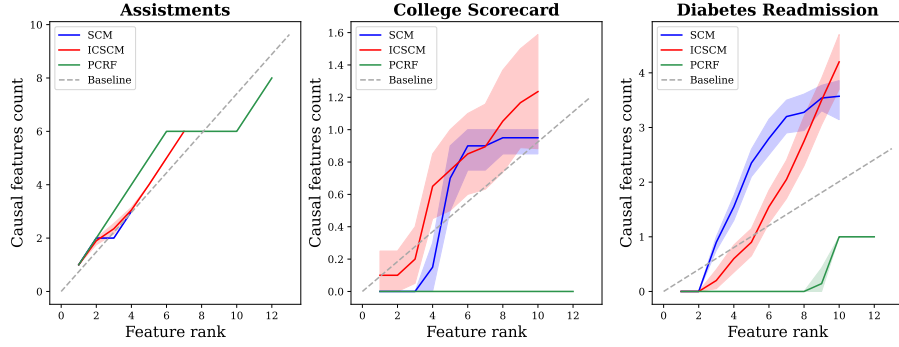

Figure 3: Accuracy scores of ICSCM models for varying value of α . Number of causal features discovered as a function of the model size (feature rank) for real-world datasets. The solid lines give the average causal feature count over 4 repetitions. The gray dashed line indicates the expected number of causal variables selected by a random pick.

2 Experiments on PC algorithm
